1. Use Colored Images for Training Rather than the blue ones.CVT2COLOR
2. Freeze layers again
3. Change cross validation style to real LOO cross validation. (Nevermind this approach is way too time consuming with augmentations. Overtraining issues)
4. Apply Transparent Background to both training and testing images to remove furthers
5. Try Doing GAN's like BeautyGAN for women and StarGAN for hairstyle, A GAN for poses will probably be most useful to get different angles of the face rather than just having a head on angle
